

Harry Potter Trivia Game - MVP Steps

Phase 1: Terminal-Based Game (Local Testing & Debugging)

- Players enter their name and house in the terminal.
- Random trivia questions are asked.
- Player types answers (basic string matching for now).
- Score is tracked, and a final message is displayed.

Phase 2: Convert to Streamlit (Basic UI for GitHub Demo)

- Convert the terminal version to Streamlit.
- Use buttons and text inputs instead of command-line inputs.
- Display images and sounds for an interactive feel.

Phase 3: Enhance with Features (NER, Difficulty Levels, Standalone Version)

- Implement Named Entity Recognition (NER) for categories.
- Adjust difficulty based on token complexity.
- Explore options for making it a standalone executable (e.g., PyInstaller or a simple Flask/Streamlit deployment).
